

Comparative representation of sound field quantities and sound energy quantities

Assumption:

German: <http://www.sengpielaudio.com/VergleichendeDarstellungVonSchall.pdf>

Air temperature = 20°C: (Atmospheric pressure 10,1325 Pa = 1013 hectopascal)

Density of air at 20°C: $\rho = 1.204 \text{ kg/m}^3$

(At 0°C is $\rho = 1.293 \text{ kg/m}^3$)

Speed of sound at 20°C: $c = 343 \text{ m/s}$

(At 0°C is $c = 331 \text{ m/s}$)

Specific acoustic impedance Z at 20°C: $Z = \rho \cdot c = \frac{p}{v} = 413 \text{ N} \cdot \text{s} / \text{m}^3$

(At 0°C is $Z = 428 \text{ N} \cdot \text{s} / \text{m}^3$)

Reference sound field quantities:

Reference sound pressure $p_0 = 2 \cdot 10^{-5} \text{ N/m}^2 = 2 \cdot 10^{-5} \text{ Pa}$ (Fixed "threshold of audibility")

Reference sound velocity $v_0 = \frac{p_0}{\rho \cdot c} = \frac{p_0}{Z_0} = 5 \cdot 10^{-8} \text{ m/s}$

(= $4.854 \cdot 10^{-8} \text{ m/s}$)

Reference sound energy quantities:

Reference sound intensity $J_0 = \frac{p_0^2}{Z_0} = Z_0 \cdot v_0^2 = 10^{-12} \text{ W/m}^2$

(= $0.9685 \cdot 10^{-12} \text{ W/m}^2$)

Reference sound energy density $E_0 = \frac{J_0}{c} = \frac{p_0 \cdot v_0}{c} = 3 \cdot 10^{-15} \text{ W} \cdot \text{m} / \text{s}^3$ (= $2.824 \cdot 10^{-15} \text{ J/m}^3$)

Reference acoustic power $W_0 = J_0 \cdot A = 10^{-12} \text{ W} = 1 \text{ pW}$ bei $A = 1 \text{ m}^2$ (= $0.9685 \cdot 10^{-12} \text{ W}$)

>>> Given:

A plane sound wave of $f = 1 \text{ kHz}$ and the

Sound pressure $\tilde{p} = 1 \text{ Pa} = 1 \frac{\text{N}}{\text{m}^2} = 10 \text{ } \mu\text{bar} \Rightarrow 94 \text{ dB SPL}$ – We use always the RMS value.

Calculated:

Wavelength $\lambda = \frac{c}{f} = \frac{343}{1000} = 0.343 \text{ m} = 34,3 \text{ cm}$

Periodic length $T = \frac{1}{f} = 0.001 \text{ s} = 1 \text{ ms}$

Sound velocity $\tilde{v} = 2 \cdot \pi \cdot f \cdot \tilde{\xi} = \frac{\tilde{p}}{Z_0} = \frac{1}{413} = 2.42 \cdot 10^{-3} \text{ m/s} = 2.42 \text{ mm/s}$

Sound particle displacement $\tilde{\xi} = \frac{\tilde{v}}{2 \cdot \pi \cdot f} = 0.385 \cdot 10^{-6} \text{ m} = 0.385 \text{ } \mu\text{m}$

Acoustic intensity $\tilde{J} = \tilde{p} \cdot \tilde{v} = \frac{\tilde{p}^2}{Z_0} = 2.42 \cdot 10^{-3} \text{ W/m}^2 = 2.42 \text{ mW/m}^2$

Intensity is not amplitude

Sound energy density $\tilde{E} = \frac{J}{c} = 7.06 \cdot 10^{-6} \text{ W} \cdot \text{s} / \text{m}^3 = 7.06 \cdot 10^{-6} \text{ J/m}^3$

Sound power \tilde{W}_0 (mit $A = 1 \text{ m}^2$) = $\tilde{J} \cdot \tilde{A} = 2,42 \cdot 10^{-3} \text{ W} = 2.42 \text{ mW}$

Level:

Differentiate sound field quantities and sound energy quantities.

Sound pressure level $L_p = 20 \cdot \log \frac{p}{p_0} = 20 \cdot \log \frac{1}{2 \cdot 10^{-5}} = 94 \text{ dB}$ (93.98 dB)

Sound velocity level $L_v = 20 \cdot \log \frac{v}{v_0} = 20 \cdot \log \frac{2.42 \cdot 10^{-3}}{5 \cdot 10^{-8}} = 94 \text{ dB}$ (93.70 dB)

Acoustic intensity level $L_J = 10 \cdot \log \frac{J}{J_0} = 10 \cdot \log \frac{2.42 \cdot 10^{-3}}{10^{-12}} = 94 \text{ dB}$ (93.84 dB)

Sound energy density level $L_E = 10 \cdot \log \frac{E}{E_0} = 10 \cdot \log \frac{2.42 \cdot 10^{-3}}{10^{-12}} = 94 \text{ dB}$ (93.84 dB)

Sound power level $L_W = 10 \cdot \log \frac{W}{W_0} = 10 \cdot \log \frac{2.42 \cdot 10^{-3}}{10^{-12}} = 94 \text{ dB}$ (93.84 dB)

Don't mix the pressure p with the power P , the sound power level is better called L_W instead of L_P . Theoretically interesting is, what sound level the full modulation of the atmospheric pressure is: $L_p = 20 \cdot \log \frac{1.013 \cdot 10^5}{2 \cdot 10^{-5}} = 194 \text{ dB SPL} \equiv 1000237 \text{ Pa}$ (RMS). But this is not the maximum possible pressure!

A previously used sound size was 1 uBar = 0.1 Pa.

Since $1 \text{ W} \cdot \text{s} = 1 \text{ N} \cdot \text{m}$, the result for the sound energy density $1 \text{ W} \cdot \text{s} / \text{m}^3 = 1 \text{ N/m}^2$ and that is the unit of sound pressure! Reminder: $\text{W} \cdot \text{s} = \text{J}$ (Joule). See also: <http://www.sengpielaudio.com/RelationshipsOfAcousticQuantities.pdf> "Relationship of acoustic quantities".
